                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    USA
             was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor Oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA (http://www.jax.org/resources/documents/dnares/). The SNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Biomedical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gi|4732114|gb|AF1290721), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent B. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWH42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                   The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method.
                                                                                                                                                                                                                                                                                Locue-specific, separate amplification of exon 2, exon 3, and/or exon of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C lalleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method.
                                                                                                                                                                                                                      Claim 4; Page 40; 128pp; English

                                                                                                                                                                                                                                The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method.
                                                                                                                                                                                                                                                                                                                                                                                                                      Locus-specific, separate amplification of exon 2, exon 3, and/or exon of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles -
                                                                                                                                                                                     Sequence 24 BP; 6 A; 8 C; 4 G; 6 T; 0 other;

                                                                                                                                                                                                                                                                  The present invention describes a method using novel primers involving the PCR-based determination of histocompatibility locus antigen B C (HLA-B) Class I group type. Determining the HLA-B Class I group type of a subject comprises: (i) combining a group-specific untranslated region primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; and (ii) determining whether a nucleic acid product is produced by the amplification; where the ability of the primer pair to produce a nucleic acid product is associated with a particular HLA group type. The method can be used for HLA-B typing. In the method, the initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. It permits the resolution of cis/trans linkages of heterozygote sequencing results which cannot be achieved with other protocols. AAX37845 to AAX38286 represent DNA sequence used in the

The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Locus-specific, separate amplification of exon 2, exon 3, and/or exon of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles -

AAV46054 and AAV46200-V46264 are primers used in isolating human histocompatibility locus antigen (HLA-A) Class I alleles which are used in a novel method of HLA Class I typing. The method involves combining a group-specific untranslated region primer pair with a target DNA to allow primer-based amplification of the DNA, and determining whether a nucleic acid product is produced by the amplification. The ability of the primer pair to produce a product is associated with a particular HLA group type. The methods can be used for typing the 3 classical HLA class I genes (comprising the loci HLA-A, HLA-B, and HLA-C) in e.g. donors and hosts for tissue transplantation. The initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. The subsequent sequencing can provide for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAV46054 and AAV46200-V46264 are primers used in isolating human histocompatibility locus antigen (HLA-A) Class I alleles which are used in a novel method of HLA Class I typing. The method involves combining a group-specific untranslated region primer pair with a tearget DNA to allow primer-based amplification of the DNA, and determining whether a nucleic acid product is produced by the amplification. The ability of the primer pair to produce a product is associated with a particular HLA group type. The methods can be used for typing the 3 classical HLA Class I genes (comprising the loci HLA-A, HLA-B, and HLA-C) in e.g. donors and hosts for tissue transplantation. The initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. The subsequent sequencing can provide for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 4; Page 128; 185pp; English.

                                                                                       The present invention describes a method using novel primers involving C the PCR-based determination of histocompatibility locus antigen B (HLA-B) Class I group type. Determining the HLA-B Class I group type of a subject comprises: (i) combining a group-specific untranslated region primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; and (ii) determining whether a nucleic acid product is produced by the amplification, where the ability of the primer pair to produce a nucleic acid product is associated with a particular HLA group type. The method can be used for HLA-B typing. In the method, the initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. It permits the resolution of cis/trans linkages of heterozygote sequencing results which cannot be achieved with other protocols. AAX37895 to AAX38286 represent DNA sequence used in the cemplification of the present invention.

Antisense oligonucleotides which inhibit inhibit DNA MeTase expression can be derived from the genomic DNA MeTase sequence. The antisense oligonucleotides can be used in investigating the role of DNA MeTase in cellular growth. They can be administered at different points in the cell cycle, or in conjugation with promoters or inhibitors of cell growth to determine the role of DNA MeTase in the growth of the cell growth of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      17-DEC-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Type of interest. The antisense oligonucleotides can also be used for inhibiting tumour growth in a mammal, or to activate silenced genes to provide a missing gene function. This ameliorates disease symptoms, e.g. in beta thalassemia and sickle cell anemia. The antisense oligonucleotides can also be used an analytical and diagnostic tools
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens.

The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Locus-specific, separate amplification of exon 2, exon 3, and/or ex of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles -

                                                                                              The present invention provides the protein and coding sequences of several polymorphic variants of the human immunoglobulin E receptor beta chain (IGERB). These contain single nucleotide polymorphisms (SNPs) which may be indicative of a predisposition to atopy, allergy, asthma, rhinitis and eczema. Also provided are the sequences of probes and primers for use in identifying the genetype of an individual with regards to the IGERB gene. The IGERB gene is found at human chromosome 11q13. The sequences are all useful in therapeutics. The present sequence was used to isolate the IGERB gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (AAIZ9513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity

                                                                                                                                                                                                                                                                                                                                                                                                                                        The primer is specific for nt 1667-1685 of HLA Class I A2 locus. It is used in a method for the prodn. of RFLP fragments for an HLA locus, together with a second primer making up a locus-specific primer (LSP) pair. It is pref. used with a Class I-specific primer which hybridises with at least two different Class I loci, pref. at least one of each of A, B, and C, and most pref. all of these. The Class I primer esp. hybridises with intervening sequence (IVS) III or IVS I sequences. Direct determination of the haplotye is possible, providing useful information for identity of individuals for e.g. paternity case and forensic investigations.
                                                                                                                                                                                                                                                                                                                                                             Sequence 19 BP; 5 A; 4 C; 7 G; 3 T; 0 other;

```
telomerase RNA (TR) comp
to a heterologous gene,
    The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be to a heterologous gene, especially a gene encoding a cytotoxin, i
```

The invention relates to

the identification of nucleic acid molecules

cc unrestricted proliferative capacity of many human cancers. Mutation or cdysregulation of the telomerase repression pathway may cause reactivation or correct or upregulation of telomerase expression in cancer. Substances, correct identified in the methods, can be used to block transcription from the TR correct interaction of the 5' regulatory sequences. These correct expensions and factors that disrupt signal transduction, are converted and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors consecuted in posteriors that promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that coplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter callows the analysis of therapeutic molecules which modulate hTR promoter activity. The present sequence represents an oligo comprising a Spl site. RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therap of cancer, especially neoplasias. The telomerase is necessary for the invention relates to promoter regions from mouse and human to (TR) component genes. The TR gene promoter can be linked to telomerase therapy

specific and human telomerase RNA gene promoters, useful for tumor gene therapy

Disclosure; Fig 12; 109pp; English

RESULT 3 AAI30062/c 밁 S Matches Query Match Best Local S reactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of telomerase RNA gene through manipulation of the hTR gene promoter allows the anticancer therapy and the cloning of the hTR gene promoter allows the anticancer therapy and the cloning of the hTR gene promoter activity. Sequences AAR207696-321 represent PCR primers used in cloning and mutagenisis of human TR gene (hTR) the unrestricted proliferative capacity of many human cancers. No or dysregulation of the telomerase repression pathway may cause Key Variation Sequence 20 BP; 5 A; 8 C; 6 G; 1 T; -0 other; Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype -18-OCT-2001 AAI30062 standard; DNA; 31 promoter region therapy of cancer, especially neoplasias.
